G-CSF MimeticsBACKGROUND OF THE INVENTION

Granulocyte colony-stimulating factor (G-CSF) is a glycoprotein secreted by
5 macrophages, fibroblasts, and endothelial cells originally identified by its ability to
stimulate the survival, proliferation, and differentiation in vitro of predominantly
neutrophilic granulocytes from bone marrow progenitors. Nicola, N. A., Annu. Rev.
Biochem. (1989) 58:45. The capacity of G-CSF to regulate in vivo granulopoiesis is
supported by animal and clinical studies, which demonstrated a reversible rise in
10 circulating neutrophil levels in response to administered recombinant G-CSF.
Gabrilove, J. L. et al., N. Engl. J. Med. (1988) 318:1414. G-CSF has pleiotropic
effects on mature neutrophils, enhancing their survival and stimulating functional
activation, including induction of neutrophil alkaline phosphatase (Sato, N. et al., J.
Cell. Physiol. (1988) 37:272) and high affinity IgA F_C receptors (Weisbart, R. H., et
15 al., Nature (Lond.) (1988) 332:647), priming for respiratory burst (Nathan, C. F.
Blood (1989) 73:301) and increased chemotaxis (Wang, J.M., Blood (1988)
72:1456). G-CSF effects have also been observed on hematopoietic cells that are
not committed to the granulocyte lineage, for example, stimulation of the
proliferation on monocytic differentiation in vitro of some myeloid leukemic cells
20 (Geissler, K., J. Immunol. (1989) 143:140) and the proliferation in vitro of some
multipotential hematopoietic precursors (Ferrero, D., Blood (1989) 73:402).

Administration of recombinant G-CSF to patients suffering from neutropenia
due to various causes indicated that G-CSF is beneficial as an adjuvant in
chemotherapy and in bone marrow transplantation (Morstyn, G., et al., Trends
25 Pharmacol. Sci. 10, (1989) 154-159). G-CSF activity is also associated with
mobilization of hematopoietic stem cells from the marrow to the peripheral blood.
(See review article, Good Review article Haylock et al., Blood 89:2233-2258, 1997).

It would be desirable to provide compounds which allow for the treatment of
neutropenia to enhance leukocyte production by acting as a G-CSF mimetics.

30 As disclosed herein it has unexpectedly been discovered that certain
octacyclic compounds are effective as G-CSF mimetics.

pharmaceutically acceptable salts, hydrates, solvates and esters thereof in a quantity 20 effective to enhance leukocyte production. The compounds of Formula (I) also provide for a method of treating the above indicated disease states because of their demonstrated ability to act as G-CSF mimetics. The drug may be administered to a patient in need thereof by any conventional route of administration, including, but not limited to, intravenous, intramuscular, oral, subcutaneous, intradermal, and 25 parenteral.

The pharmaceutically active compounds of the present invention are incorporated into convenient dosage forms such as capsules, tablets, or injectable preparations. Solid or liquid pharmaceutical carriers are employed. Solid carriers include, starch, lactose, calcium sulfate dihydrate, terra alba, sucrose, talc, gelatin, 30 agar, pectin, acacia, magnesium stearate, and stearic acid. Liquid carriers include syrup, peanut oil, olive oil, saline, and water. Similarly, the carrier or diluent may

include any prolonged release material, such as glyceryl monostearate or glyceryl distearate, alone or with a wax. The amount of solid carrier varies widely but, preferably, will be from about 25 mg to about 1 g per dosage unit. When a liquid carrier is used, the preparation will be in the form of a syrup, elixir, emulsion, soft gelatin capsule, sterile injectable liquid such as an ampoule, or an aqueous or nonaqueous liquid suspension.

The pharmaceutical preparations are made following conventional techniques of a pharmaceutical chemist involving mixing, granulating, and compressing, when necessary, for tablet forms, or mixing, filling and dissolving the ingredients, as appropriate, to give the desired oral or parenteral products.

Doses of the presently invented pharmaceutically active compounds in a pharmaceutical dosage unit as described above will be an efficacious, nontoxic quantity preferably selected from the range of 0.001 - 100 mg/kg of active compound, preferably 0.001 - 50 mg/kg. When treating a human patient in need of a G-CSF mimetic, the selected dose is administered preferably from 1-6 times daily, orally or parenterally. Preferred forms of parenteral administration include topically, rectally, transdermally, by injection and continuously by infusion. Oral dosage units for human administration preferably contain from 0.05 to 3500 mg, preferably 0.1 to 350 mg of active compound. Oral administration, which uses lower dosages is preferred. Parenteral administration, at high dosages, however, also can be used when safe and convenient for the patient.

Optimal dosages to be administered may be readily determined by those skilled in the art, and will vary with the particular G-CSF mimetic in use, the strength of the preparation, the mode of administration, and the advancement of the disease condition. Additional factors depending on the particular patient being treated will result in a need to adjust dosages, including patient age, weight, diet, and time of administration.

The method of this invention of inducing G-CSF mimetic activity in mammals, including humans, comprises administering to a subject in need of such activity an effective amount of of a presently invented G-CSF mimetic compound.

The invention also provides for the use of a compound of Formula (1) in the manufacture of a medicament for use as a G-CSF mimetic.

25 The invention also provides for a process for preparing a pharmaceutical composition containing a pharmaceutically acceptable carrier or diluent and a compound of Formula (1) which comprises bringing the compound of Formula (1) into association with the pharmaceutically acceptable carrier or diluent.

No unacceptable toxicological effects are expected when compounds of the invention are administered in accordance with the present invention.

30 In addition, the pharmaceutically active compounds of the present invention can be co-administered with further active ingredients, such as other compounds

known to treat bacterial infections, fungal infections, neutropenia, including chemotherapy-induced neutropenia and bone marrow transplantation and in mobilizing peripheral blood stem cells and other conditions with depressed leukocyte production, or compounds known to have utility when used in combination with a G-CSF mimetic or agents known to have utility when used in combination with such G-CSF mimetics.
